

UDACITY

Introduction to Generative AI with AWS Screenshots Report

Screenshot of the Model_FineTuning.ipynb file with the cell output of the input: “Outline the key aspects of ubiquitous computing from a data management perspective.”

The screenshot shows a Jupyter Notebook with two tabs: 'Model_FineTuning.ipynb' and 'Model_Evaluation_UdacityGe...'. The 'Model_FineTuning.ipynb' tab is active, displaying a code cell [7] with a payload dictionary and a prediction function. The output of the cell is a text generation result for the input "Outline the key aspects of ubiquitous computing from a data management perspective.".

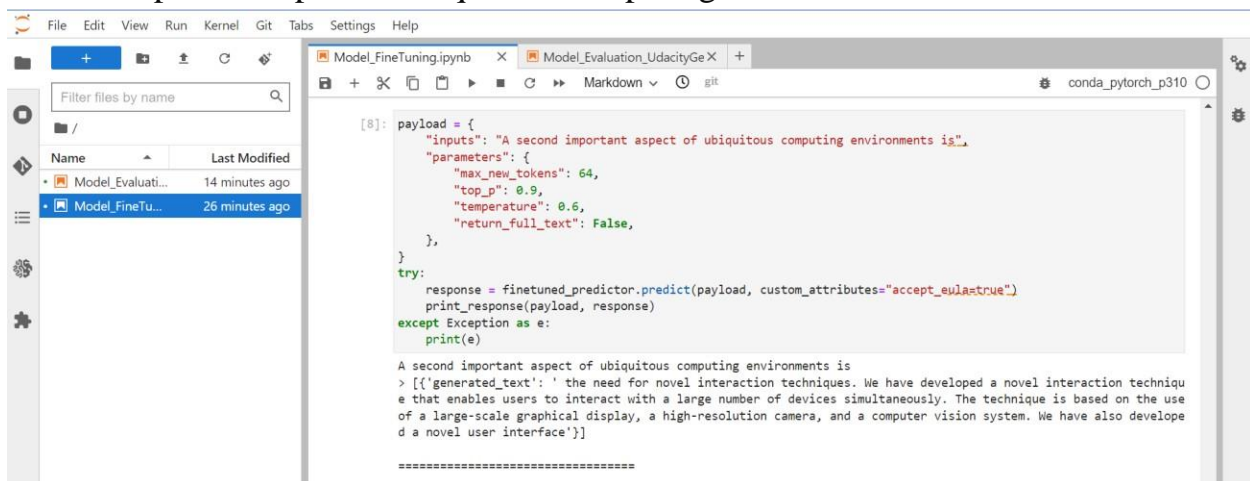

```
[7]: payload = {
      "inputs": "Outline the key aspects of ubiquitous computing from a data management perspective.",
      "parameters": {
        "max_new_tokens": 64,
        "top_p": 0.9,
        "temperature": 0.6,
        "return_full_text": False,
      },
    }
    try:
      response = finetuned_predictor.predict(payload, custom_attributes="accept_eula=true")
      print_response(payload, response)
    except Exception as e:
      print(e)
```

Outline the key aspects of ubiquitous computing from a data management perspective.

```
> [{'generated_text': '\nUbiquitous computing is a relatively new field that has been gaining popularity in recent years. It is a term that refers to the use of technology to make computing devices and systems available and accessible to people in everyday life. This technology can be used to make computing devices and systems more convenient, efficient'}]]
```

=====

Screenshot of the Model_FineTuning.ipynb file with the cell output of the input: “A second important aspect of ubiquitous computing environments is”.

The screenshot shows the same Jupyter Notebook interface as the previous one, but with a different code cell [8] and output. The input is "A second important aspect of ubiquitous computing environments is".

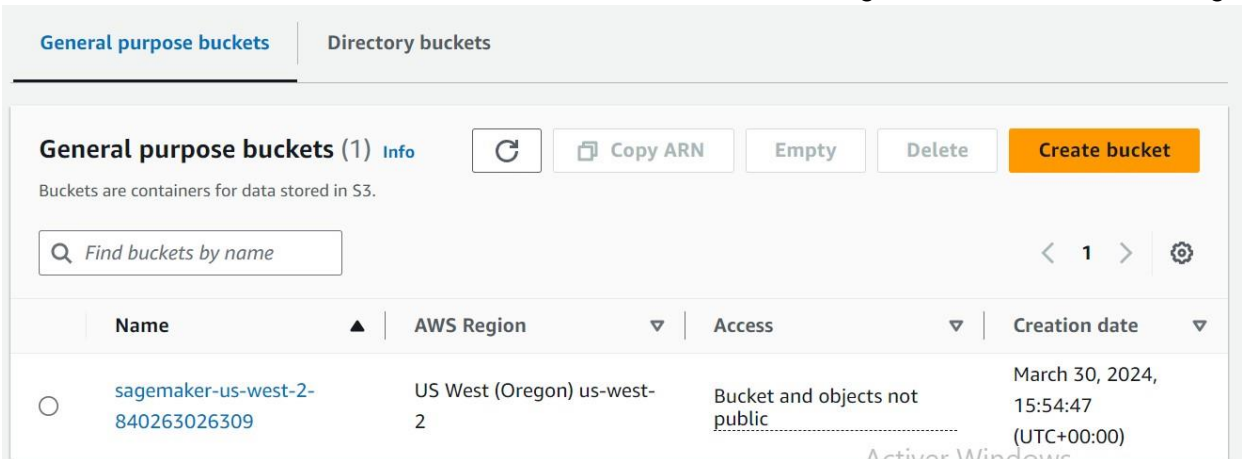

```
[8]: payload = {
      "inputs": "A second important aspect of ubiquitous computing environments is",
      "parameters": {
        "max_new_tokens": 64,
        "top_p": 0.9,
        "temperature": 0.6,
        "return_full_text": False,
      },
    }
    try:
      response = finetuned_predictor.predict(payload, custom_attributes="accept_eula=true")
      print_response(payload, response)
    except Exception as e:
      print(e)
```

A second important aspect of ubiquitous computing environments is

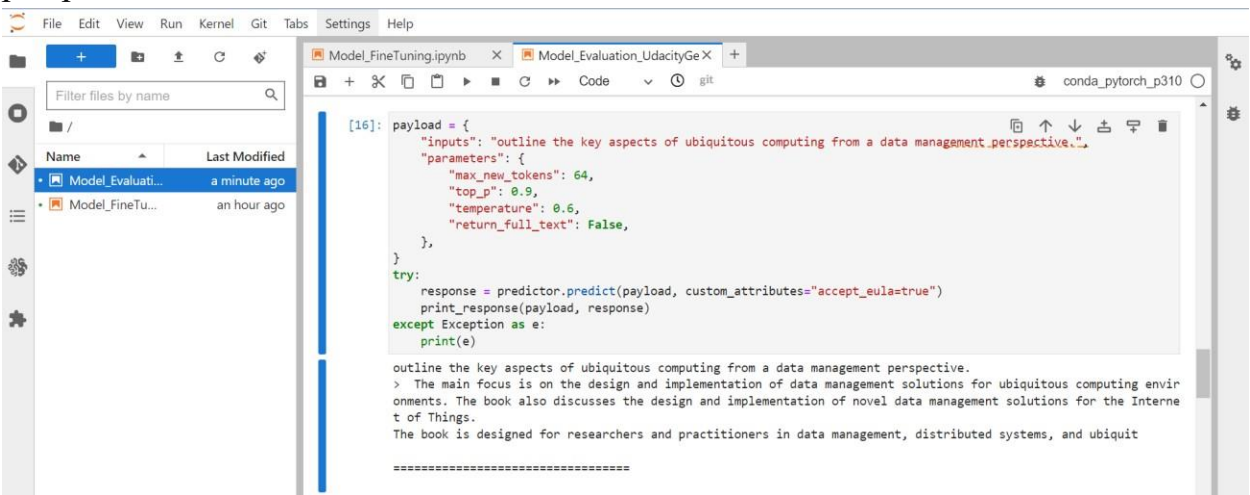

```
> [{'generated_text': ' the need for novel interaction techniques. We have developed a novel interaction technique that enables users to interact with a large number of devices simultaneously. The technique is based on the use of a large-scale graphical display, a high-resolution camera, and a computer vision system. We have also developed a novel user interface'}]]
```

=====

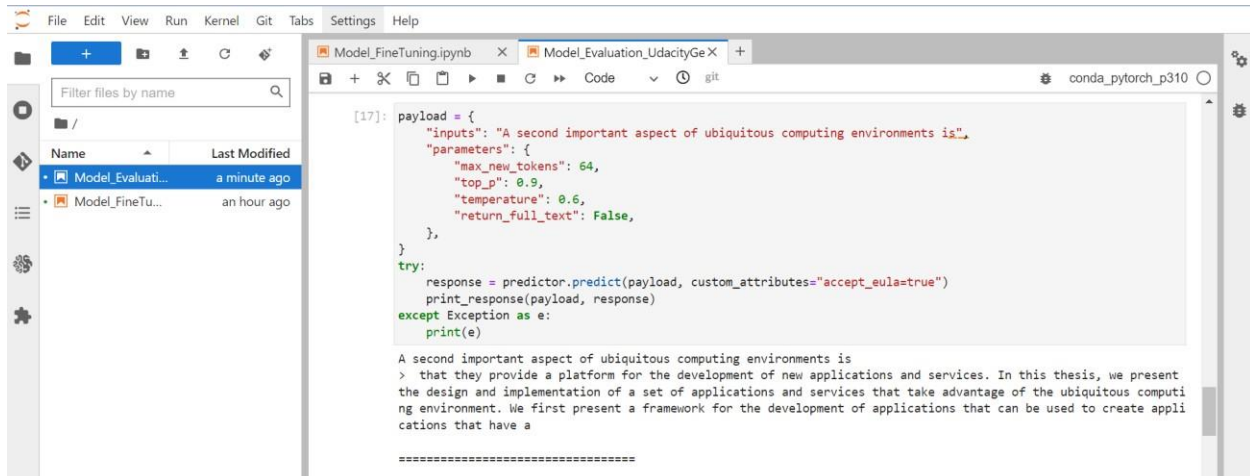

Screenshot of the AWS S3 bucket where the fine-tuned model weights are stored after training.

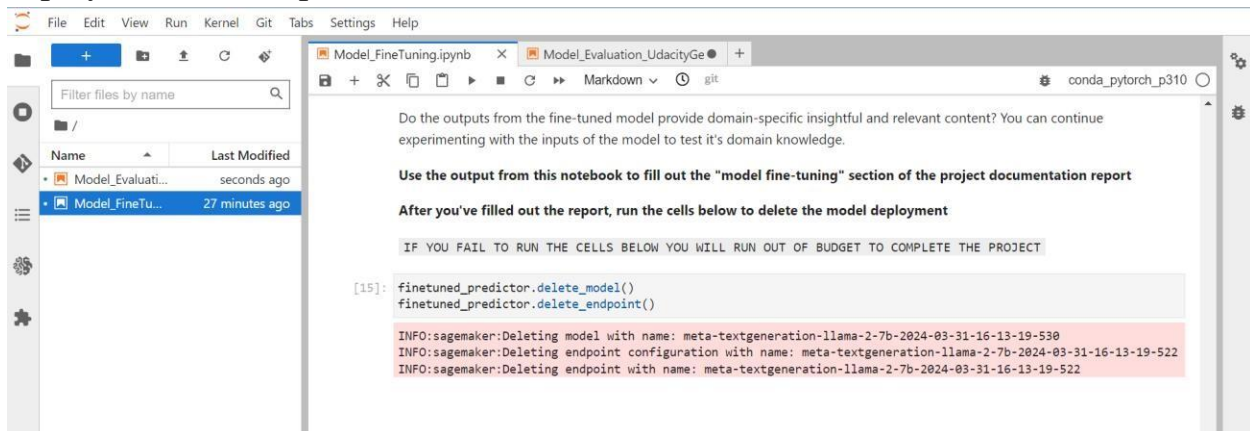

Screenshot of the Model_Evaluation.ipynb file with the cell output of the input: “Outline the key aspects of ubiquitous computing from a data management perspective.”

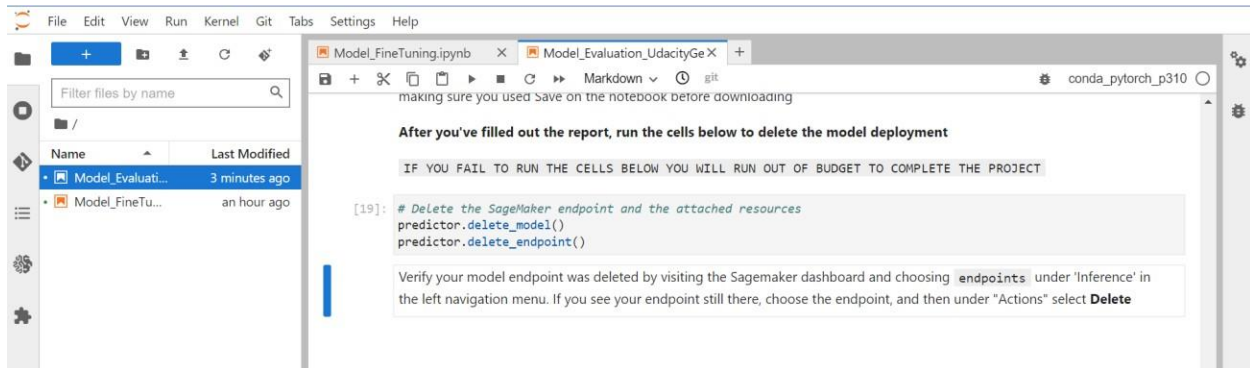

Screenshot of the Model_Evaluation.ipynb file with the celloutput of the input:
“A second important aspect of ubiquitous computing environments is”.

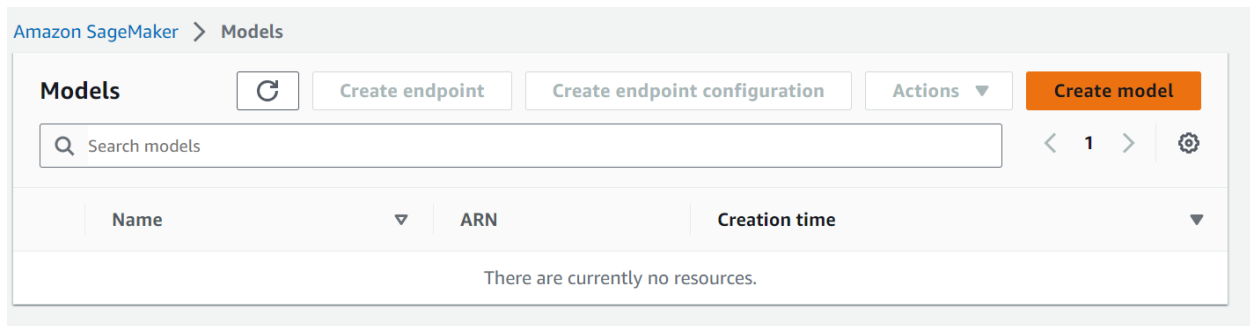

Screenshot of the Model_FineTuning.ipynb file with the cell that delete the model deployment and endpoint ran.

Screenshot of the Model_Evaluation.ipynb file with the cell that delete the model deployment and endpoint ran.

Screenshot of verification of the model has been deleted.

Screenshot of verification of the endpoint has been deleted.
